

# Over Voltage and Over Current Protection IC

## General Description

ET9611Y is an Over-Voltage-Protection (OVP) and Over-Current-Protection (OCP) device. It can disconnect IN to OUT to protect load in case wrong input operating conditions are detected. The system is positive over-voltage protected up to 36V. The internal over-voltage thresholds (OVLO) is 6.1V and internal over-current thresholds (OCP) is 2.7A. ET9611Y also has internal over temperature protect(OTP) function and it can monitor chip temperature to protect the device.

The device is packaged in advanced full-Green DFN4 package .

## Functional Description

The OVP switch with over-voltage protection feature a low 100mΩ (typical) on-resistance( $R_{ON}$ ) internal FET and protect low-voltage systems against voltage faults up to 36V<sub>DC</sub>. The internal over-voltage thresholds (OVLO) is 6.1V and internal over-current thresholds (OCP) is 2.7A.

The internal FET turns off when the junction temperature exceeds +155 °C (TYP). The device exits thermal shutdown after the junction temperature cools by 20 °C (TYP.).

### Input Capacitor

To limit the voltage drop on the input supply caused by transient inrush current when the switch turns on into a discharged load capacitor or short-circuit, a capacitor 1uF or larger must be placed between the IN and GND pins.

### Output Capacitor

A 1uF or larger capacitor should be placed between the OUT and GND pins.

## Absolute Maximum Ratings

Stresses exceeding the absolute maximum ratings may damage the device. The device may not function or be operable above the recommended operating conditions and stressing the parts to these levels is not recommended. In addition, extended exposure to stresses above the recommended operating conditions may affect device reliability. The absolute maximum ratings are stress ratings only.
