

800mA Dual-rail Very Low Dropout LDO

General Description

The ET551ADJY1B is a CMOS-based low-dropout, low-power linear regulators, offering 800mA with NMOS pass transistor and a separate bias supply voltage (VBIAS) . The device provides very stable, accurate output voltage with low noise, high ripple rejection and low supply current suitable for space constrained, noise sensitive application. The ET551ADJY1B series consist of an accurate voltage-reference block, an error amplifier, a thermal-shutdown circuit, and a current limit circuit.

The ET551ADJY1B is available in the DFN6(1.2mm ×1.2mm) package.

Features

- Wide VIN Input Voltage Range: 0.8V to 5.5V
- Wide VBIAS Voltage Range: 2.7V to 5.5V
- ADJ Output Voltage Range: 0.8V to 3.6V
- Very Low VBIAS Input Current of Typ. 80μA
- Ultra Low Dropout: Typ. 240mV at 800mA, 1.1V Output, 3.3V Bias
- Built-in Over Current Protection and Thermal Shutdown Circuit
- Built-in Auto-discharging Circuit
- Built-in Under Voltage Lock-out
- Stable with a 2.2μF Ceramic Capacitor
- Package: DFN6 (1.2mm × 1.2mm × 0.4mm)
- MSL: Level 1

Applications

- Constant-voltage Power Supply for Battery-Powered Device
- Constant-voltage Power Supply for Smartphones, Tablets
- Constant-voltage Power Supply for Cameras, DVRs, STB and Camcorders

ET551ADJY1B

Pin Configuration

Pin Function

Pin Name	Symbol	Pin Description
1	OUT	The power output of the device.
2	ADJ	Adjustable Regulator Feedback Input. Connect to output voltage resistor divider central node.
3	EN	Enable Input.
4	BIAS	Input voltage for controlling circuit.
5	GND	Ground pin.
6	IN	Input voltage Pin. Large bulk capacitance should be placed closely to this pin. A 1 μ F ceramic capacitor is recommended at this pin.
	TP	Thermal pad, connect to GND

ET551ADJY1B

Block Diagram

Functional Description

The ET551ADJY1B dual-rail very low dropout voltage regulator is using NMOS pass transistor for output voltage regulation from V_{IN} voltage. All the low current internal control circuitry is powered from the V_{BIAS} voltage.

The use of an NMOS pass transistor offers several advantages in applications. Unlike PMOS topology devices, the output capacitor has reduced impact on loop stability. V_{IN} to V_{OUT} operating voltage difference can be very low compared with standard PMOS regulators in very low V_{IN} applications.

The ET551ADJY1B offers smooth monotonic start-up.

Input and Output Capacitor

The device is designed to be stable for ceramic output capacitors with Effective capacitance in the range from 2.2μF to 4.7μF. The device is also stable with multiple capacitors in parallel, having the total effective capacitance in the specified range. In applications where no low input supplies impedance available (PCB inductance in V_{IN} and/or V_{BIAS} inputs as example), the recommended $C_{IN} = 1\mu F$ and $C_{BIAS} = 0.1\mu F$ or greater.

Enable Pin Operation

The ET551ADJY1B is turned on by setting the EN pin to “H”. The threshold limits are covered in the electrical characteristics table in this datasheet. When the EN pin is not used, connect the EN pin with V_{BIAS} to keep the LDO in operating mode.

ET551ADJY1B

Current Limit Protection

When output current of VOUT pin is higher than current limit threshold or the VOUT pin is direct short to GND, the current limit protection will be triggered and clamp the output current at a predesigned level to prevent over-current and thermal damage.

Thermal Shutdown Protection

Thermal protection disables the output when the junction temperature rises to approximately +165°C, allowing the device to cool down. When the junction temperature reduces to approximately +145°C the output circuit is enabled again. Depending on power dissipation, thermal resistance, and ambient temperature, the thermal protection circuit may cycle on and off. This cycling limits the heat dissipation of the regulator, protecting it from damage due to overheating.

Auto Discharging

When the EN pin set to “L”, the output circuit will be disable immediately, and the Auto-Discharging circuit will be turned on to discharge the electric charge on output capacitor, and decrease the voltage of V_{OUT} in very short time. The Auto-Discharging function is optional.

Output Voltage Adjust

The required output voltage of Adjustable devices can be adjusted from V_{REF} to 3.6 V using two external resistors. Typical application schematics is shown blow.

$$V_{OUT} = V_{REF} \times (1+R1/R2)$$

Typical value of V_{REF} is 0.8V. It is recommended to keep the total serial resistance of resistors (R1+R2) not greater than 100KΩ.

The output voltage needs to take into account the error caused by the resistance accuracy.

Absolute Maximum Ratings

Symbol	Item	Rating	Unit
V _{IN}	Input Voltage(VIN Pin)	-0.3 to 6.0	V
V _{BIAS}	Input Voltage (VBIAS Pin)	-0.3 to 6.0	V
V _{EN}	Input Voltage (EN Pin)	-0.3 to 6.0	V
V _{FB}	Input Voltage (ADJ Pin)	-0.3 to 6.0	V
V _{OUT}	Output Voltage	-0.3 to 6.0	V
I _{OUT_MAX}	Maximum Load Current	800	mA
PD _{MAX}	Maximum Power Consumption	640	mW
T _{STG}	Storage Temperature Range	-65 to +150	°C
T _J	Operating Junction Temperature	-40 to +150	°C
V _{ESD}	Human Body Model (JESD22-A114)	±4000	V
	Charged Device Model (JESD22-C101)	±1500	V
I _{LU}	Latch up Current Maximum Rating (JESD78E)	±200	mA

Recommended Operating Conditions

Symbol	Item	Rating	Unit
V _{IN}	IN Input Voltage	V _{OUT} + V _{DROP} to 5.5	V
V _{BIAS}	BIAS Input Voltage	2.7 to 5.5 & V _{BIAS} ≥V _{OUT} +1.4V	V
I _{OUT}	Output Current	0 to 800	mA
T _A	Operating Ambient Temperature	-40 to 85	°C
C _{IN}	Effective Input Ceramic Capacitor Value	0.47 to 10	μF
C _{BIAS}	Effective Input Ceramic Capacitor Value	0.047 to 4.7	μF
C _{OUT}	Effective Output Ceramic Capacitor Value	2.2 to 4.7	μF
ESR	Input and Output Capacitor Equivalent Series Resistance	5 to 100	mΩ

Thermal Shutdown Temperature	T _{TSD}	Temperature increasing		165		°C
Thermal Shutdown Released Temperature	T _{TSR}	Temperature decreasing		145		°C

Notes:

1: The maximum input voltage should take into account the maximum power consumption (P_{D(MAX)}).

The calculation formula is as follows:

$$P_{D(MAX)} = (V_{IN(MAX)} - V_{OUT}) \times I_{OUT}$$

The maximum power consumption of the circuit is 640mW.

$$V_{IN(MAX)} = 640mW / I_{OUT} + V_{OUT}$$

For example:

If V_{OUT}= 1.1V, I_{OUT}=800mA, The maximum input voltage is V_{IN(MAX)}=640mW / 800mA+1.1=1.9V

If I_{OUT} >500mA, V_{BIAS} should be bigger than V_{OUT}+1.6V.

2: V_{DROP} FT test method: test the V_{OUT} voltage at V_{SET} +V_{DROPMAX} with output current.

3: Guaranteed by design and characterization. not a FT item.

4: Since the power on process of BIAS needs a large current, the BIAS input voltage should have a current driving capacity of more than 120mA.

ET551ADJY1B

Application Circuits

Notes*:

1: Adjust Version: $V_{OUT} = 0.8 \times (1 + R1/R2)$, $(R1 + R2)$ no greater than $100\text{k}\Omega$.

2: The feedforward capacitor C_{FF} is optional for the optimization of transient response.
