

## 7-Channel LDO PMIC for Camera Applications

### General Description

The ET59171 is CMOS-based low-dropout, low-power linear regulator. It's a 7-channel integrated LDOs for camera applications. Two channels offering max 1500mA with NMOS pass transistor, five channels offering max 600mA with PMOS pass transistor. ET59171 include 1000kHz high speed I<sup>2</sup>C interface, the function setting is flexible such as power sequence, output voltage, output discharge, current limit per channel. The ET59171 also integrates the fault monitoring features with interrupt indication.

The ET59171 is available in WLCSP20(1.8mm × 1.544mm, 0.35mm pitch), Wafer-Level Chip-Scale Package.

### Features

- LDO1 and LDO2
  - VIN12 Input Voltage Range: 0.6V to 2.0V
  - LDO1/2 Output: 0.496V~1.8V@8mV/Step
  - Max 1500mA Output Current Capability
  - Ultra Low Dropout: Typ.100mV at 1500mA, 1.2V Output
- LDO3~LDO7
  - VIN34/VIN5/VIN6/VIN7 Input Voltage Range: 1.8V to 5.5V
  - LDO3~LDO7 Output: 1.380V~3.412V@ 8mV/Step
  - Max 600mA Output Current Capability
  - Less Than 10uV(typ) Noise
  - Ultra Low Dropout: Typ.110mV at 600mA, 2.8V Output
- Very Low Input Quiescent Current of Typ. 120μA
- Operation Guaranteed with Battery Voltage Down to 2.7V
- Programmable Power Start-Up/Down Sequencing
- Built-in Thermal Global Shutdown Protection (OTP)
- Built-in Under Voltage Protection(UVP)
- Built-in Over Current Protection(OCP) and Auto-discharging Circuit
- Built-in Under Voltage Lockout (UVLO)
- I<sup>2</sup>C Serial Control to Program Output Voltage and Features
- Support Dynamic Voltage Adjustment Function
- Part No. and Package Information

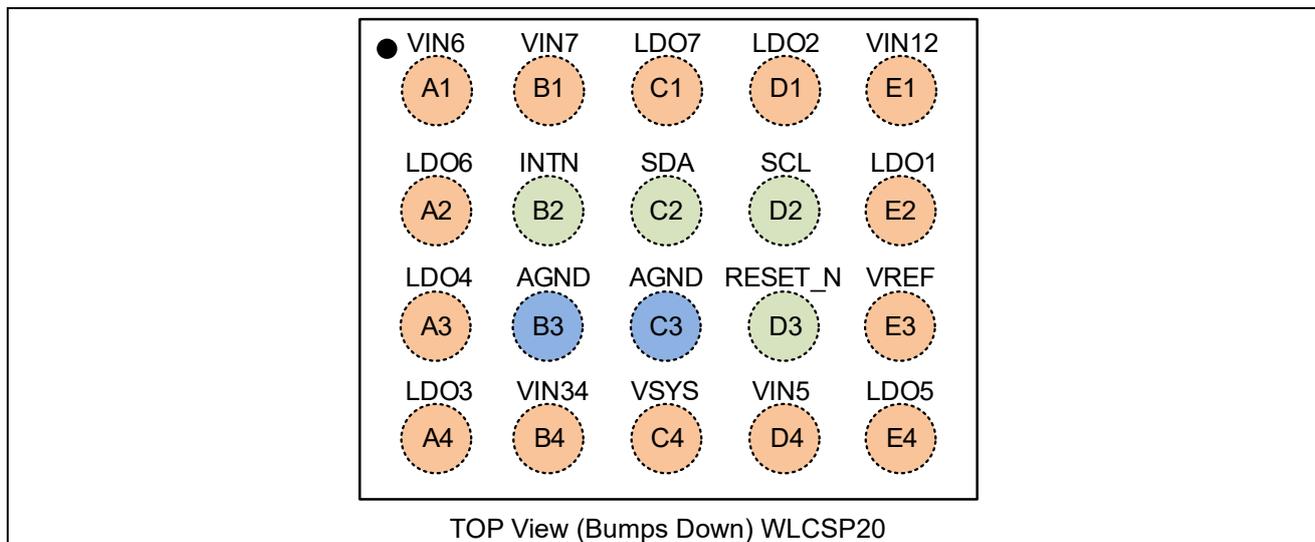

Part No.	Package	MSL
ET59171	WLCSP20 (1.8mm×1.544mm,0.35mm pitch)	1

### Applications

- Constant-voltage power supply for battery-powered device
- Constant-voltage power supply for smartphones, tablets
- Constant-voltage power supply for cameras, DVRs, STB and camcorders

# ET59171

## Pin Configuration

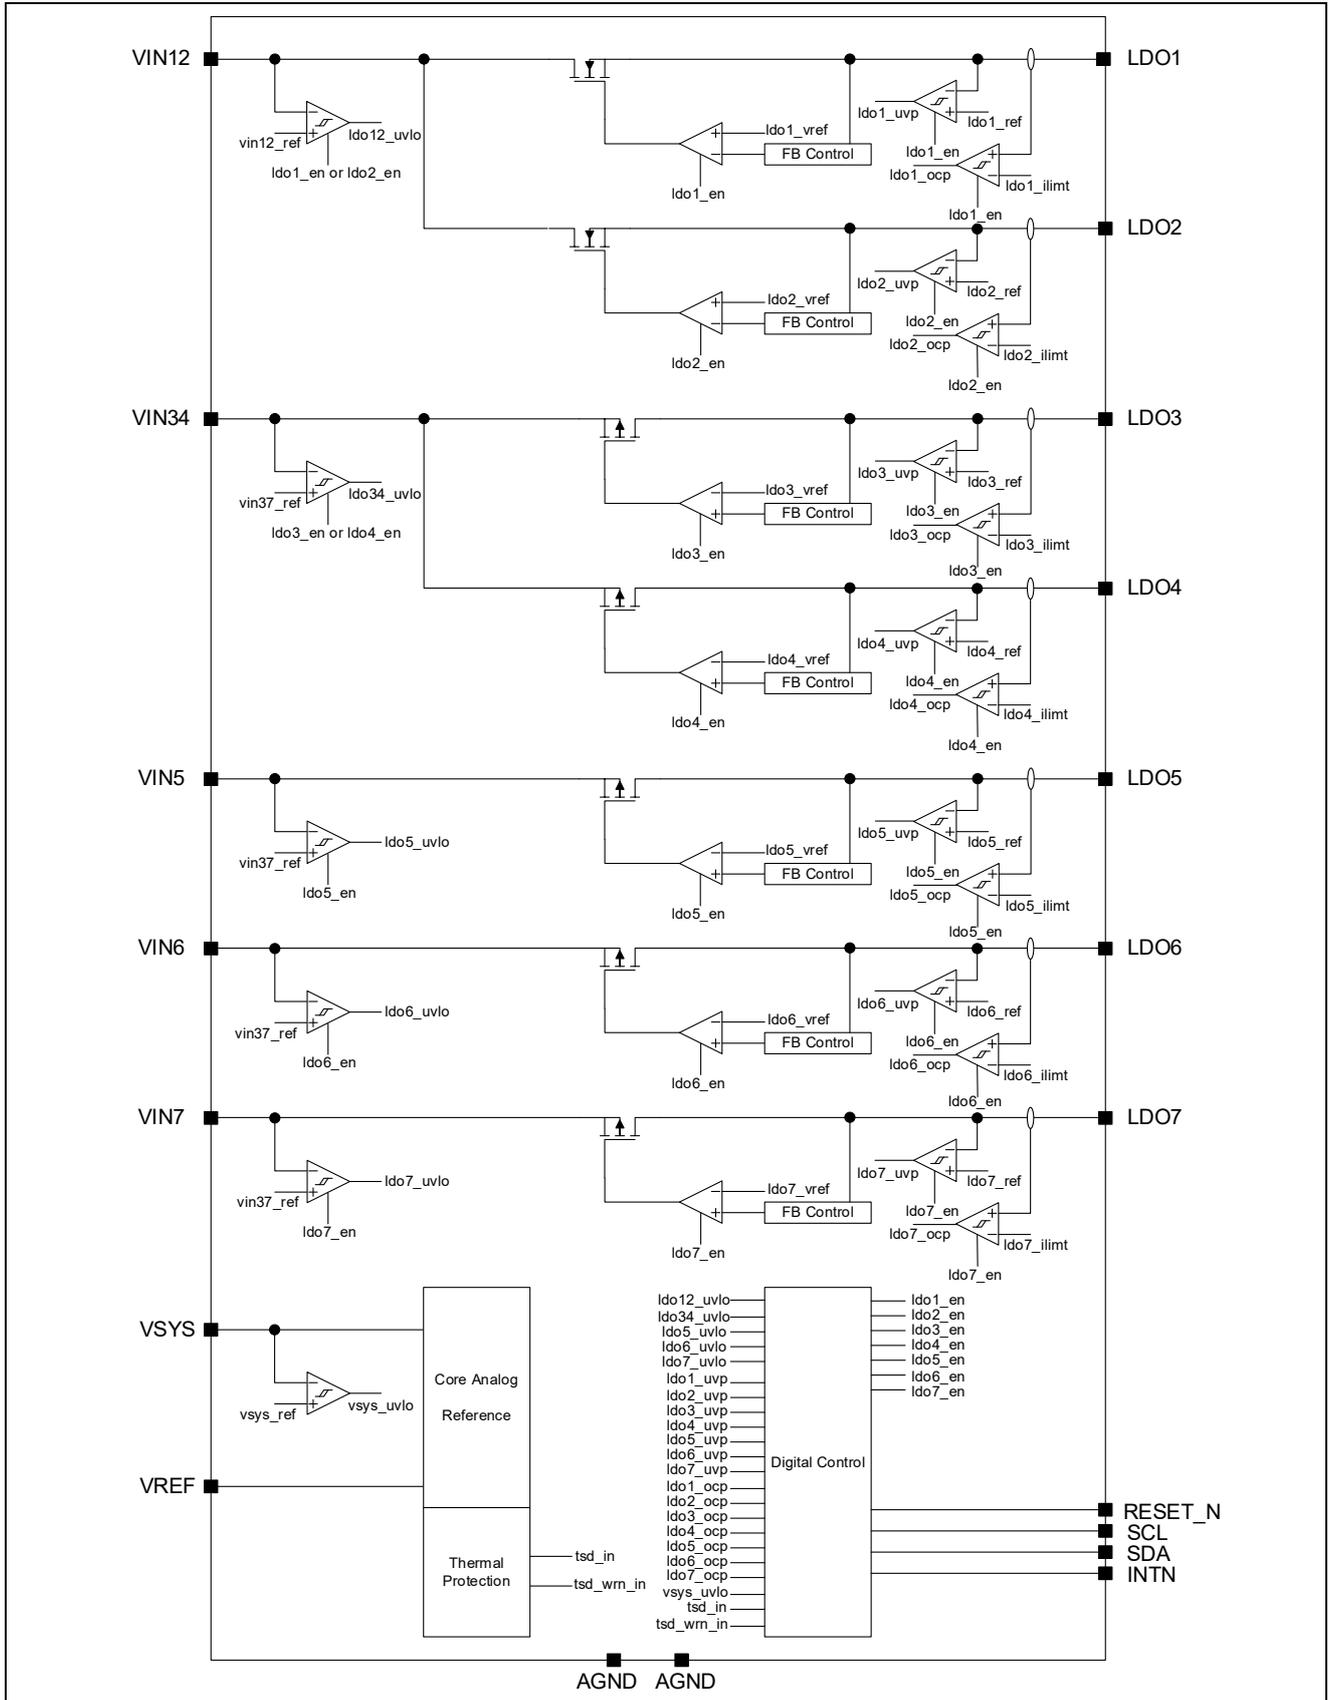

## Pin Function

Pin No.	Pin Name	Pin Function
A1	VIN6	Input Power Pin for LDO6.
A2	LDO6	LDO6 Regulator Output
A3	LDO4	LDO4 Regulator Output
A4	LDO3	LDO3 Regulator Output
B1	VIN7	Input Power Pin for LDO7.
B2	INTN	Interface Pin for Interrupts. Open-drain or Push-pull Mode; The Output Voltage of Push-pull Can Be Selected to 1.2V Or 1.8V. This Pin Returns to Low When all I <sup>2</sup> C Interrupt
B3	AGND	Ground Pin.
B4	VIN34	Input Power Pin for LDO3 And LDO4.
C1	LDO7	LDO7 Regulator Output
C2	SDA	I <sup>2</sup> C Data Pin. Node Should Be Tied High Through a Pull Up Resistor.
C3	AGND	Ground Pin.
C4	VSYS	System Power Pin. Route Trace from System to This Pin.
D1	LDO2	LDO2 Regulator Output
D2	SCL	I <sup>2</sup> C Clock Pin. Node Should Be Tied High Through a Pull Up Resistor.
D3	RESET_N	RESET_N Pin Is Used to Enable Basic Circuits Necessary for Controlling the PMIC And Reset All the Digital Block. The RESET_N Pin Has an Internal Pull-Down and Should Always Be Connected to a Logic High or Low.
D4	VIN5	Input Power Pin for LDO5.
E1	VIN12	Input Power Pin for LDO1 And LDO2.
E2	LDO1	LDO1 Regulator Output
E3	VREF	Reference Bypass Pin. If Used, Connect A 100nf Capacitor Between This Pin and Analog Ground.
E4	LDO5	LDO5 Regulator Output

# ET59171

## Block Diagram

# ET59171

## Functional Description

ET59171 has 7 LDO regulators. LDO1/2 are using NMOS pass transistor for output voltage regulation. The others LDOs are using PMOS pass transistor for output voltage regulation. The ET59171 LDO1 and LDO2 output voltages can be programmed via I<sup>2</sup>C from 0.496V to 1.8V in 8mV steps and LDO3-LDO7 can be programmed from 1.380V to 3.412V in 8mV steps using the associated I<sup>2</sup>C registers. The voltage transition going from a lower to a higher voltage is a single step with transition time dependent on output current and output capacitance. The output current drives the voltage slew rate from higher to lower voltage transitions.

The device is in reset when the RESET\_N is low and will power up the device's main control circuits when RESET\_N is pulled high.

If LDOx\_EN bits are set to 1 prior to VSYS\_EN bit being asserted to 1, the LDOs will power up a short time after VSYS\_EN is set to 1. When the VSYS\_EN bit is set to 0, all LDOs will be shut off, and SUSD\_STAU(0x1b) register will be cleared. Additionally, all fault counters will reset to 0.

When RESET\_N is pulled high and SYS\_EN bit is set to 1, each LDO can be accomplished using I<sup>2</sup>C register LDOx\_EN bit in register 0x03 or the LDOs can be powered up/down sequentially using the Sequence State Machine, settable using the register bits in registers 0x0B to 0x0F. The device is also designed to support multiple start-up or shut-down sequences for multiple module loads.

The current limit and deglitch timer of each LDO can be programmed to optimize the LDO performance for the application. The device monitors each power input pin and each LDO output. If any of these below a threshold a status and interrupt bit are set.

### RESET\_N pin, VSYS\_EN Bit and ENABLE BITS

The tables below provide the states of the LDOs based on the combination of the RESET\_N pin, register bit VSYS\_EN and enable register bits.

RESET_N	VSYS_EN	LDOX_SEQ	LDOX_EN	SEQ_CONTROL Dependent	On/Off
0	Reset to 0	Reset to 0	Reset to 0	No	Off
1	0	000	0	No	Off
1	1	000	0	No	Off
1	0	>000	0	No	Off
1	1	>000	0	Yes	CNTL
1	0	000	1	No	Off
1	1	000	1	No	ON
1	0	>000	1	No	Off
1	1	>000	1	Yes	CNTL

**Note:** CNTL indicates that the state of the output will be dependent on the setting of the seq\_ctrl[1:0] bits. When RESET\_PIN is high and vsys\_en bit is set to 1, seq\_ctrl[1:0] = 2'b01 will enable any outputs based on their LDOX\_SEQ > 000.

# ET59171

## Power Up/down Sequence Control

The recommended power on sequence of ET59171 is to power on VSYS first, then power on input power VINx, then set RESET\_N to high level, and then enable LDOx. The corresponding power off sequence is to turn off LDOx first, then set RESET\_N to low level, then power off input power VINx, and finally power off VSYS.

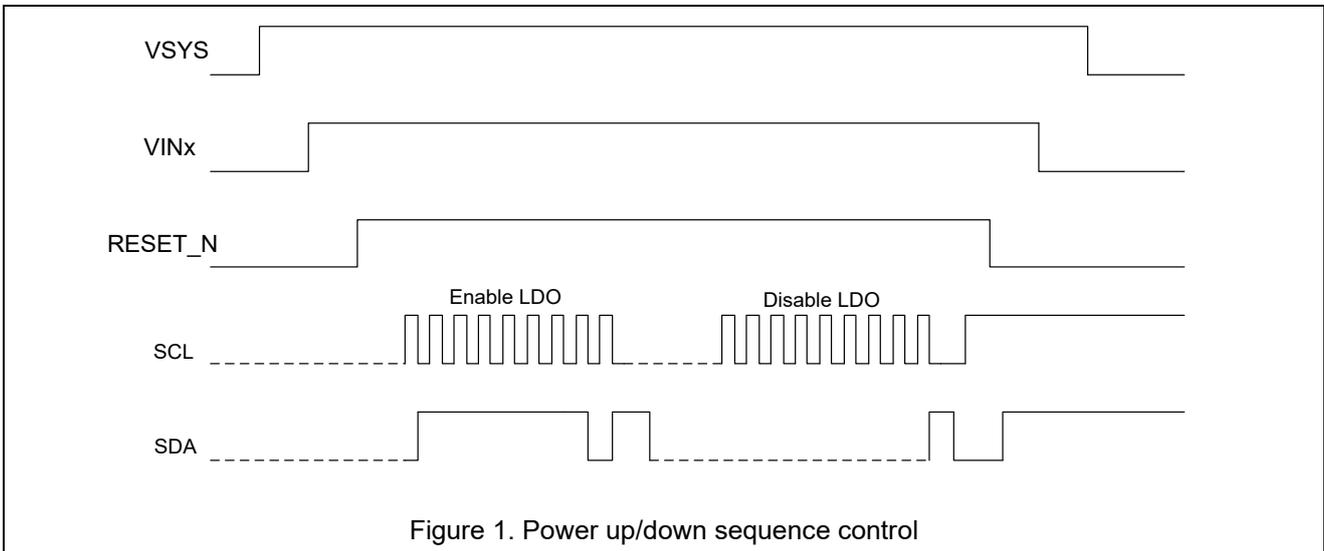

Figure 1. Power up/down sequence control

The ET59171 LDO's can be enabled two ways using the I<sup>2</sup>C register bits if RESET\_N is high.

1. Setting LDOX\_SEQ=000 in 0x0B(LDO12\_SEQ) or 0x0C(LDO34\_SEQ) or 0x0D(LDO56\_SEQ) or 0x0E(LDO7\_SEQ) and the LDOX\_EN assigned to the LDO in register 0x03, ENABLE to 1.
2. Setting LDOX\_SEQ>000 in registers 0x0B/C/D/E and then set seq\_ctrl[1:0] = 2'b01 in the 0x0F, SEQ\_CTR register.

ET59171 LDOs have internal soft-start which limits the battery current to the setting LDOX\_ILIM in register 0x02. If an LDO output fails to reach 90% of the programmed voltage at start-up, a UVP fault is declared. See the output UVP section for description of LDO.

Power-up and shut down of each regulator can be controlled by an I<sup>2</sup>C register. It can be set at the registers ldox\_seq[2:0] (x = 1 to 7) respectively. ldox\_en is an internal signal to enable one of regulators, if ldox\_seq[2:0] set to '000', that LDOX channel can be controlled directly by a bit specified in register LDO\_EN. LDOX\_VSET[7:0] can set output voltage of each channel.

3. Automatic power up/down sequence control.

ET59171 has seven SLOTS to which each regulator can be assigned.

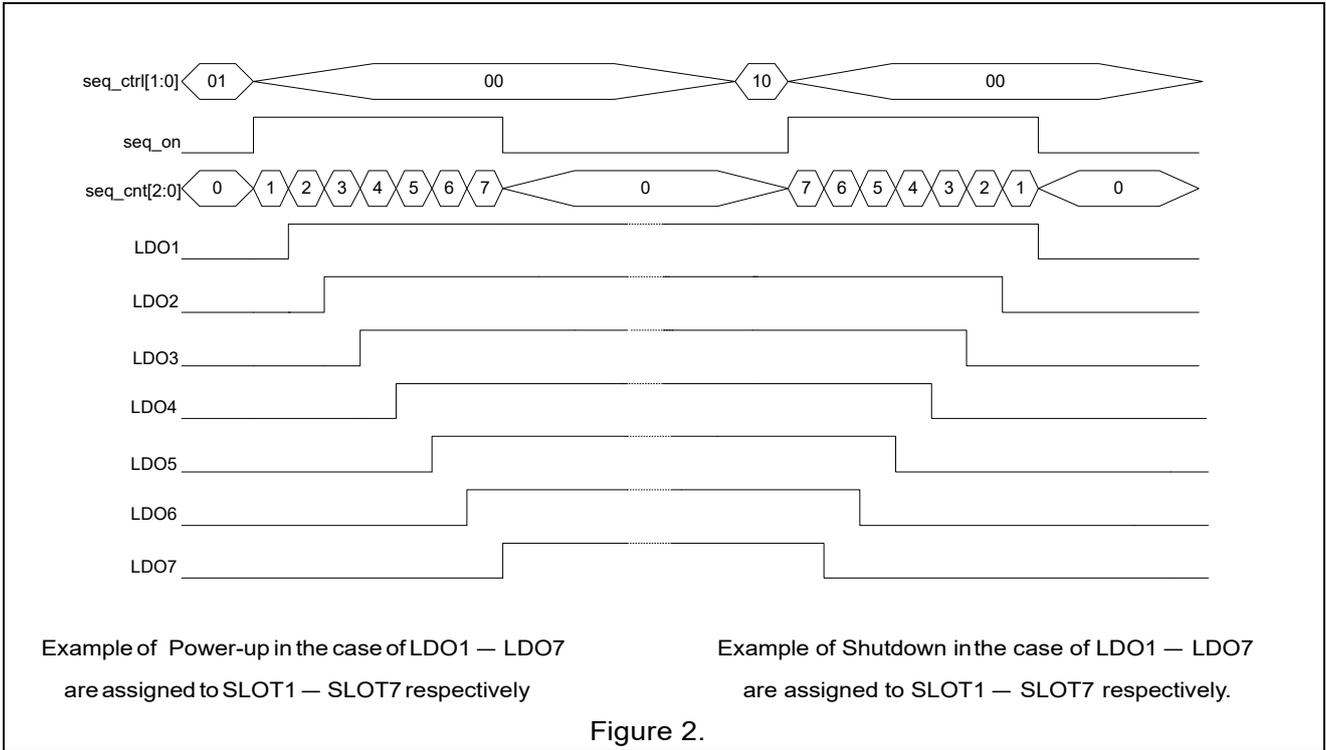

They are started by seq\_ctrl[1:0] signal. when seq\_ctrl[1:0] is set '01'. Internal counter seq\_cnt[2:0] starts increments from 0 ("000") to 7 ("111"). When seq\_ctrl[1:0] is set '10', seq\_cnt[2:0] decrements from 7 ("111") to 0 ("000"). Regulators assigned to one of SLOTS starts power-up or power-down.

The seq\_cnt[2:0] matches the SLOT number, when seq\_cnt[2:0] = 000, it indicates that sequencing has completed or not started.

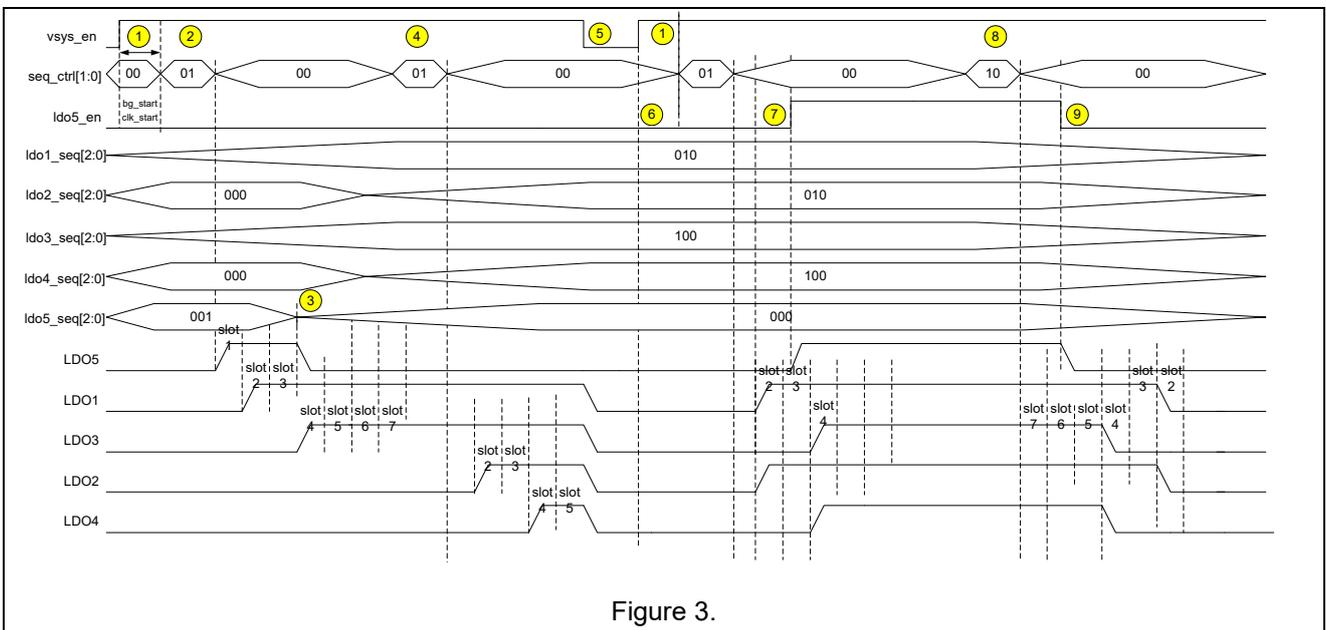

Internal logic signal seq\_on = 1 indicates that sequencing is executing and somewhere between the start of

# ET59171

slot 1 and the end of slot 7, seq\_on=0, it indicates that has completed or not started.

## Sequence Timing and Control

### State Description:

1. vsys\_en is set to 1 and the band gap and internal clock are started. A minimum time of 100us needs to be allowed between vsys\_en being asserted high and seq\_ctrl[1:0] changed to 01 in order for the device to transition from shutdown to Sleep mode where the Bandgap and digital circuitry are enabled.
2. Upon seq\_ctrl[1:0] being set to 01, LDO5 is started in slot 1 (ldo5\_seq[2:0] = 001). seq\_ctrl[1:0] bits are cleared immediately after the sequence is initiated. LDO1 and LDO3 are started in the associated slot given to

# ET59171

---

their `ldox_seq` value.

3. The `ldo5_seq[2:0]` is set to 000, disabling the LDO.
4. `ldo2_seq[2:0]` and `ldo4_seq[2:0]` are set and a new sequence is started when `seq_ctrl[1:0]` is set to 01 again. The state of any other LDO is not changed.
5. `vsys_en` is set to 0 and all LDOs are disabled.
6. `vsys_en` is set to 1 enabling the IC.
7. `ldo5_en` is set to 1 and LDO5 is enable.
8. `seq_ctrl[1:0]` is set to 10, starting a shutdown sequence
9. Asynchronous to the shutdown sequence LDO5 is disabled when `ldo5_en=0`.

If an LDO faults during a start-up sequence, the other LDOs will still be started in their assigned time slot. The `ldox_seq[2:0]` bits for the faulted LDO will remain set to the assigned slot. The system can then attempt to start the faulted LDO in another sequence by setting the `seq_ctrl[1:0]` bits to 01 or by clearing the `ldox_seq[2:0]` bits to 000 and then writing a "1" to the `ldox_en` Enable bit.

## Shutdown

To disable the ET59171 LDO(s), set the I<sup>2</sup>C register bit, `ldox_en` assigned to the LDO in register 0x03 to 0 or if register, 0x0F, `SEQ_CTRL` bits [5:4], `seq_ctrl[1:0]` is set to "10" and `ldox_seq[2:0]>000`, the LDO(s) will be disabled in the Reserved order of time slot they are assigned. To do a global shutdown of all LDOs set the `RESET_N` pin low.

## Multiple Fault Shutdown

To prevent repetitive starting and faulting of an LDO, detection of 3 failures will result in a complete shutdown of the LDO. If for instance LDO1 where to have a qualifying UVP condition and the LDO was disabled, LDO1 will be restarted 20ms later. If LDO1 where disable three times due to any faults (UVP, OCP or Short Circuit), LDO1 would be permanently shutdown until it is re-enabled by I<sup>2</sup>C commands. When LDO1 is shutdown under such a condition, the `LDO1_EN` bit is set to 0 and the `ldo1_seq[2:0]` is set to 000. This shutdown behavior applies to all of the ET59171 LDOs.

If UVP, OCP occurs when `flt_sd_b` is set to 1, the LDO(s) is not disabled and the fault counter is not incremented, but the interrupt and status bits indicate the fault occurred. `flt_sd_b=1` doesn't prevent shutdown of LDOs when `VIN12`, `VIN34`, `VIN5`, `VIN6` or `VIN7` are in a UVLO condition, but the fault counter is not incremented.

## LDO FAULTS(VINX\_UVLO or LDOX\_OCP or LDOX\_UVP)

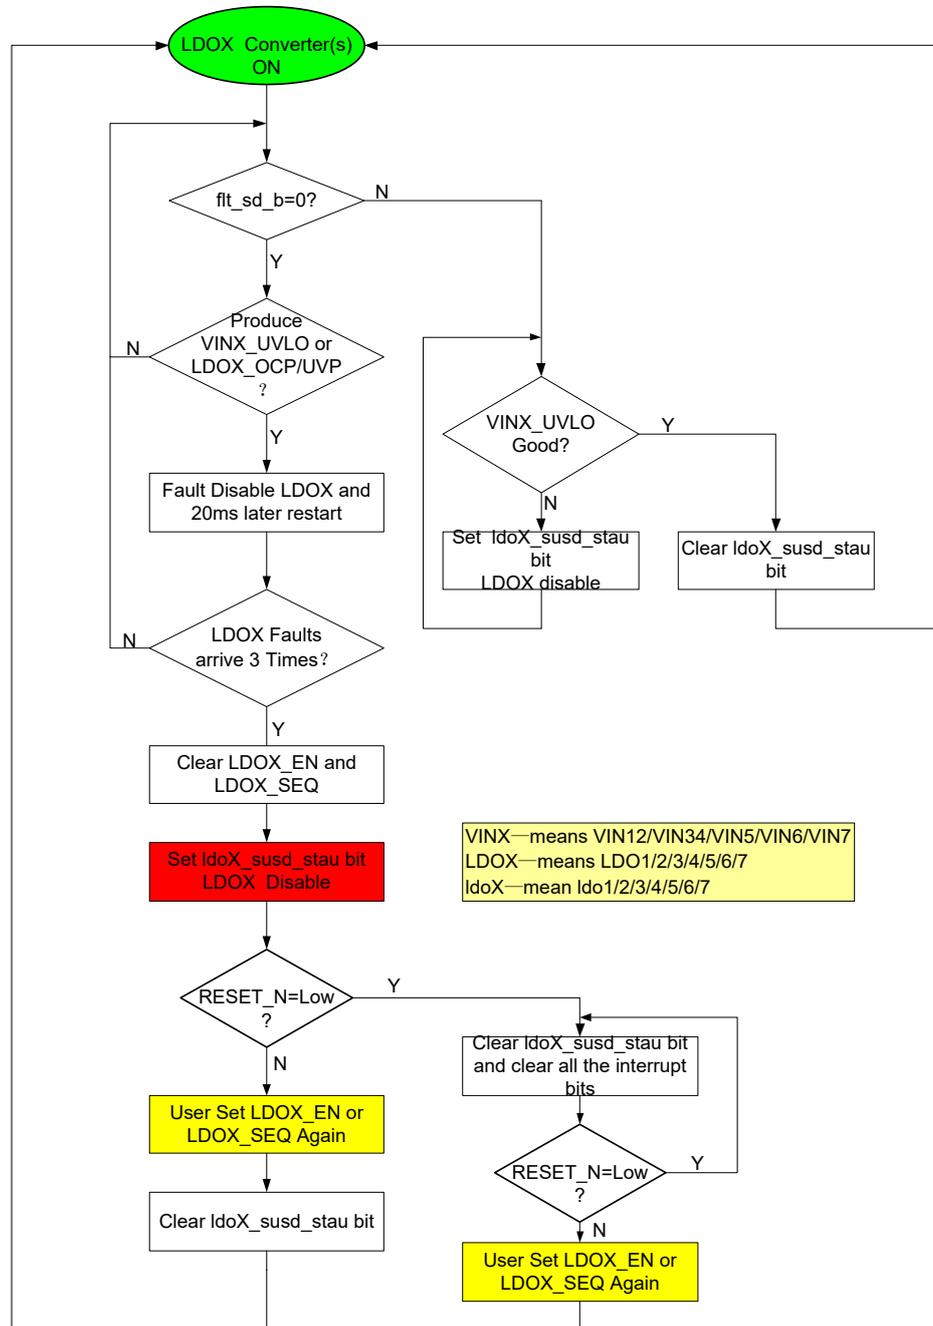

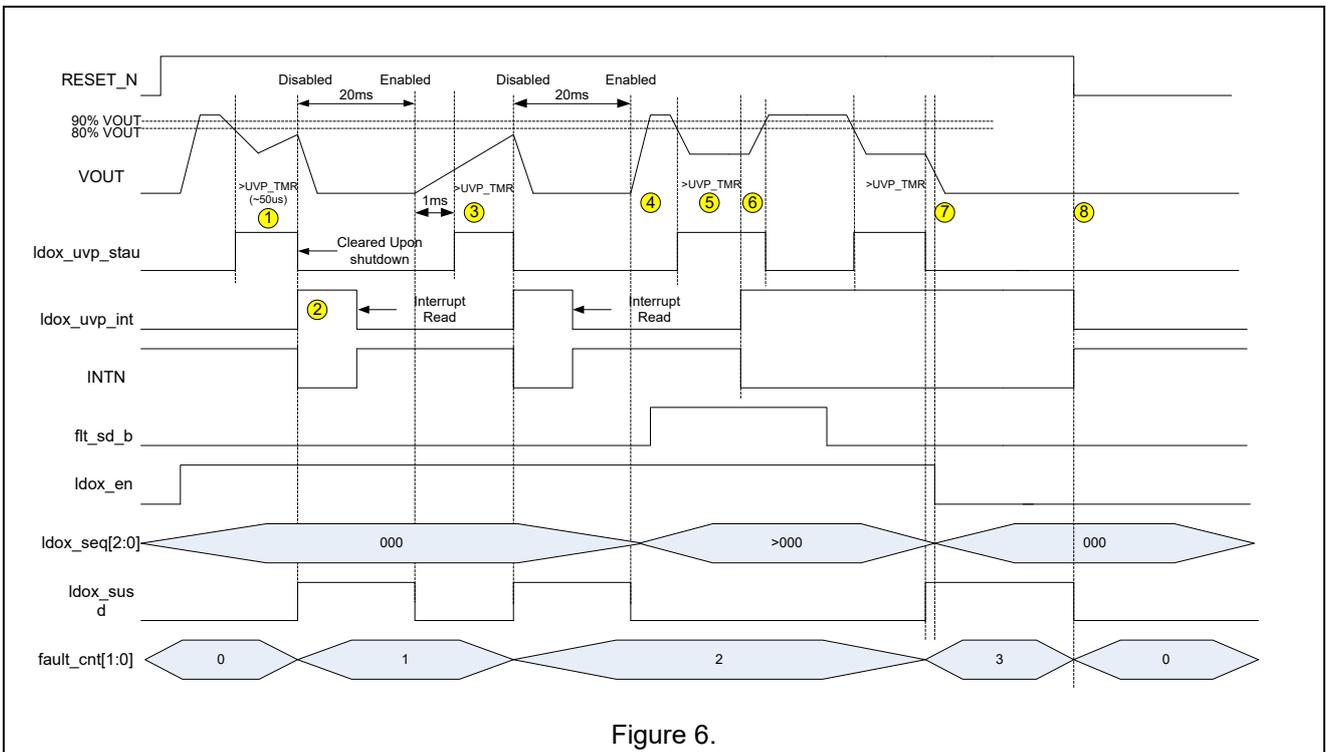

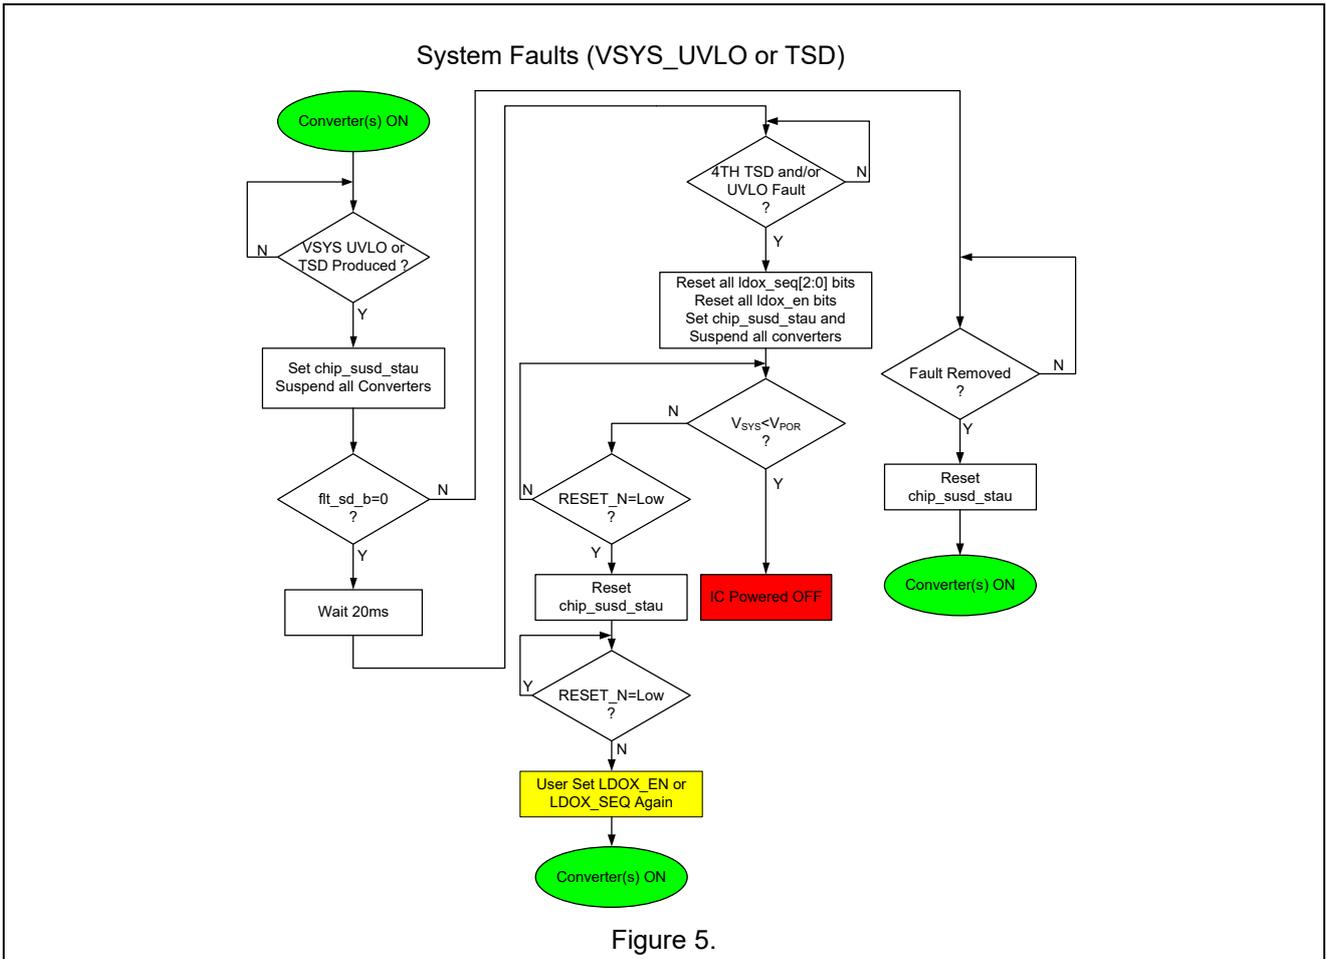

Figure 4.

When flt\_sd\_b=0, if there are any combination of four VSYS\_UVLO and/or Thermal Shutdown faults (shutdown and after 20ms restart again for 4 times), the device will permanently shutdown and the chip\_susd\_stau bit will be set until RESET\_N has been set to low and is set to high again; When flt\_sd\_b=1, if there is VSYS\_UVLO or Thermal Shutdown faults, the device will shutdown and restart until the faults are released.

# ET59171

---

## State Description

1. A timer starts at the beginning of a UVP event and the UVP condition remains for the timer length(>50us), the converter is disabled for the first time.
2. The converter `ldox_uvp_stau` is set and 50us later the `ldo_uvp_int` bit is set and the INTN pin is pulled down(open-drain output mode). The converter is disabled and the `ldo_uvp_stau` bit is blanked, the `ldox_susd` bit is set while the conveter is suspended until the next start. The `fault_cnt[1:0]` is incremented upon shutdown.
3. The converter fails to reach `UVP_Rising(90% Vtarget)` within 1ms of restart-up. Since the `flt_sd_b=0`, a second UVP failure is counted.
4. At the restart, the interrupt bit remains a 1until read. The `ldox_susd` bit is reset by the restart action. The converter successfully reaches a voltage above `UVP_Rising` within 1ms and runs. Meanwhile the `flt_sd_b` and `ldox_seq[2:0]` are set to 1 and >000 respectively.
5. With `flt_sd_b` set to 1 when the fault occurs, the converter remains on, but the interrupt bit is set to one and INTN pin is pulled down. The `ldox_susd` bit remains a "0" since the converter remains enabled.
6. The `ldo_uvp_stau` is set when the fault occurs, but clears when the converter is >90% of the target voltage.
7. When the converter is shutdown for the third time, the `ldox_en` is set to 0; `ldox_seq` is set to 000; The `ldox_uvp_stau` bit is set to 0. The `fault_cnt[1:0]` keep three and `ldox_susd` keep high level.
8. When `RESET_N` is set to high, the `fault_cnt[1:0]` is cleared to 0 and `ldox_susd` is cleared to 0. At the same time, `ldox_uvp_int` is cleared to 0. Another way to clear `fault_cnt[1:0]` and `ldox_susd` bits is reset the `ldox_en` or `ldox_seq` bit, and LDOx will restart again.

## UVLO Rising

All LDOs use VSYS to power their analog and control circuitry. For proper operation the VSYS input is monitored for under voltage conditions. LDO1 and LDO2 use VIN12, LDO3 and LDO4 use VIN34, LDO5 uses VIN5, LDO6 uses VIN6 and LDO7 uses VIN7 to power their outputs.

If VSYS is greater than the POR threshold (~2.0V), but did not reach `VSYS_UVLO_RISE` when `RESET_EN` is high, a UVLO interrupt `vsys_uvlo_int` bit and the status bit `sys_uvlo_stau` are set and the INTN pin is asserted low. When the LDO(s) are commanded to start or are running when VSYS falls below the UVLO threshold, but above VPOR, a re-start of the LDO(s) will be attempted again for the longer of 20ms (`flt_sd_b=0`) or when the VSYS rises above the `VSYS_UVLO_RISE` threshold. While in this state, the `chip_susd_stau` bit is set. The status bit remains set to "1" only while `VSYS>VSYS_UVLO_RISE`. The Interrupt bit will be cleared when read.

LDO1 and LDO2 may temporarily start if one or both VIN12 and VSYS have not reached `VIN12_UVLO_THRESHOLD_RISING` or `VSYS_UVLO_RISE` level respectively prior to the LDO being enabled. If VSYS is good, but VIN12 is not when LDO1 and/or LDO2 are enabled, the interrupt bit `ldo12_uvlo_int` and status bit, `ldo12_uvlo_stau` are set and the INTN pin will be pulled low. Additionally, `ldo1_susd` and/or `ldo2_susd` will be set to "1" the longer of 20ms(`flt_sd_b=0`) or until VIN12 is greater than `VIN12_UVLO_RISE`. At which time the SUSD bits will be cleared and the LDO(s) started. The `ldo12_uvlo_stau`, status bit remains set as long as `VIN12 < VIN_UVLO_RISE`. Similarly UVLO for VSYS, the LDO will not be restarted for a minimum of 20ms

# ET59171

and until VIN12 is greater than VIN12\_UVLO\_RISE. When the set output is low and the input voltage is less than 1.0V, the state of VIN12\_UVLO should be ignored.

UVLO for LDO3 and LDO4 are identical to that described above for LDO1 and LDO2. The UVLO threshold for LDO3 and LDO4 are VIN34\_UVLO\_RISE. Behavior for LDO5, LDO6 and LDO7 are similar relative to VIN5, VIN6 and VIN7 as that discussed for LDO1.

## Notes:

- Status bits may not be reliable until VSYS has reached a level of ~2.0V (VPORmax).
- The power on speed of VSYS should be faster than 2.7v/ms, otherwise it will be interrupted due to UVLO.

## UVLO Falling

If VSYS falls below its VSYS\_UVLO\_FALL, falling threshold while one or more of the LDOs are enabled, a UVLO interrupt in 0x17, vsys\_uvlo\_int is set and the INTN pin is pulled low. A status bit in register 0x1A, vsys\_uvlo\_stau is also set while the rail remains below the rising UVLO threshold. Likewise, if VIN12, VIN34, VIN5, VIN6 or VIN7 fall below their falling threshold while the respective LDO is enabled, the associated input TSD\_UVLO\_STAU register bits will be momentarily set, the bits in TSD\_UVLO\_INT will be set and the INTN pin is pulled low. Then the LDOs will be disabled, the status bit reset and the associated ldox\_susd bit in 0x1B, SUSD\_STAU set to indicate the supply has been suspended.

## PMIC Operation in VSYS UVLO

VSYS State	RESET_N	VSYS_EN	Results
VSYS < VPOR	Low	1	Device in Shutdown, I <sup>2</sup> C Registers Not Reliable
VPOR < VSYS < UVLO	Low	1	Device in Shutdown, I <sup>2</sup> C Registers Not Reliable
VSYS > UVLO	Low	1	Device in Shutdown, I <sup>2</sup> C Registers Not Reliable
VSYS < VPOR	High	1	Device in Shutdown, I <sup>2</sup> C Registers Not Reliable
VPOR < VSYS < UVLO	High	1	Band Gap On, I <sup>2</sup> C Registers Readable. It Will Report the VSYS UVLO Fault.
VPOR < VSYS < UVLO	High	0	Band Gap Off, I <sup>2</sup> C Registers Readable. It Will Report the VSYS UVLO Fault.
VSYS > UVLO	High	1	Band Gap On. Device Can Enable by I <sup>2</sup> C.

When an over-temperature or a VSYS UVLO event occurs, all ET59171 LDOs are disabled for a minimum of 20ms(ft\_sd\_b = 0). For UVLO on the LDO inputs, the individual LDO's will be disabled for a minimum of 20ms(ft\_sd\_b = 0) and until the voltage rises above UVLO\_VSYS\_RISE.

## Current Limit Protection

For each channel, when output current of LDO output pin is higher than current limit threshold or the output pin is direct short to GND, the current limit protection will be triggered and clamp the output current at a predesigned level to prevent over-current and thermal damage. Set related bits to select Current limit threshold register.

The LDO output current is short-circuit protected and the short-circuit current level can be programmed using the settings in register 0x02, LDO\_ILIMIT. When a short occurs(VLDO1/2 < 35%VSET, VLDO3~7 < 0.5V) on the LDOx output, the current is automatically limited to the programmed current limit and Vout may drop, depending on the difference between the input and target output voltage. The resultant VOUT is the product

# ET59171

of current limit setting in register 0x02 LDO\_ILIMIT and the load impedance. When current limit is detected, the associated OCP status bit in 0x19, OCP\_STAU is set to "1", If the LDOx remains in current limit for 1ms(default value), an interrupt bit in register 0x16, OCP\_INT is generated and the INTN pin is pulled low. Then the LDOx is disabled, the status bit in 0x16 OCP\_STAU register is reset to 0 and the associated suspend bit in the 0x1B SUSPEND\_STAU register is set to "1".

The LDOx will attempt a restart 20ms later( $flr\_sd\_b = 0$ ) and the associated suspend will be reset to "0". If the associated interrupt bit was not read while the output was suspended, the interrupt will remain a 1 after restart and INTN (if not masked) will remain low.

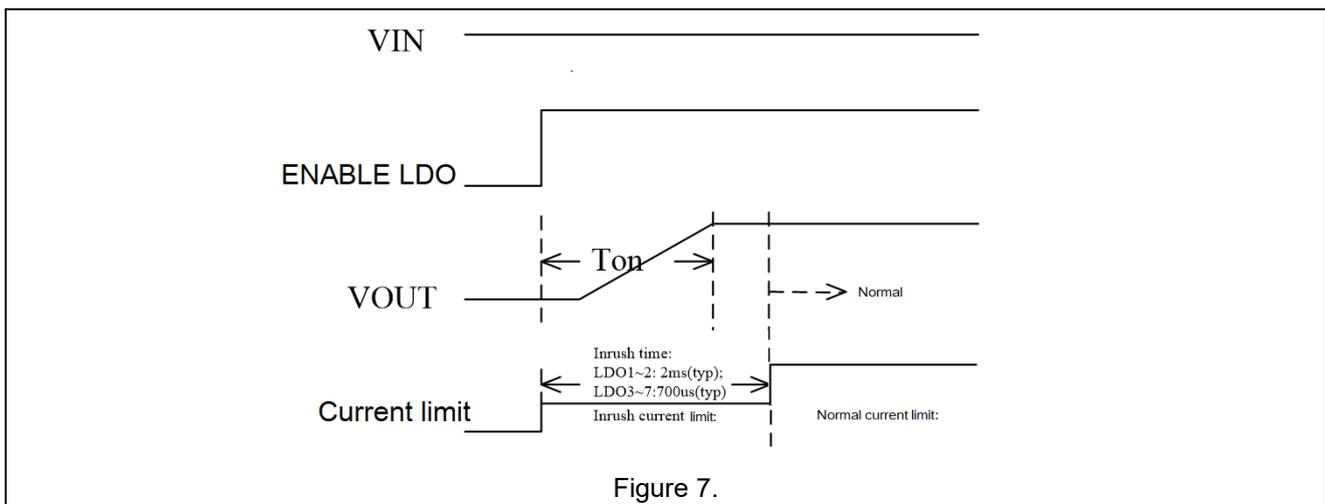

**Note:** The OCP deglitch timer can be programmed to one of four periods by setting Reg. 0x11, bits [2:1].

## Inrush Current Limit

After enable the LDOs, the inrush current limit circuit is in operation, LDO1~2 inrush time is approximately 2ms, and LDO3~7 inrush time is approximately 700us. Therefore, the load current should be drawn after the output voltage reached the preset value.

If the load current is drawn during the start-up, it should be within the following values:

$$I_{OUTX} \leq 2/3 * \text{Normal current limit}$$

## Thermal Shutdown Protection

When the die temperature rises to a nominal 125°C, a thermal warning interrupt occurs setting the  $tsd\_wrn\_int$  bit to "1" and INTN pin is pulled low. The  $tsd\_wrn\_stau$  register bit will be set to "1" and remain set until the die temperature drops to a nominal value of 100°C.

If the die temperature continues to rise above the thermal warning level, a Thermal Shutdown event is activated at a nominally 145°C. When the Thermal Shutdown level is reached, all power outputs are disabled without shutdown sequencing, but I<sup>2</sup>C communications remain. The device remains in thermal shutdown until the die temperature falls to approximately +120°C.

At the time a Thermal Shutdown detection occurs, the  $tsd\_int$ , interrupt bit is set and the INTN pin is pulled low to notify the system of the event. The  $tsd\_stau$ , register bit is also set and will remain set as long as the device is above TWRN°C. The  $C\_SUSD$  bit is set while the device is shutdown due to the overtemp condition.

# ET59171

In the first UVP detection case, the `ldox_uvp_stau` bit is set when the fault is detected and after a 50us wait period, the `ldox_uvp_int` bit is set and the INTN pin is pulled low. The LDO output is disabled, the Status bit is reset and then the associated `ldox_susd` bit in SUSD\_STAU register is set. After 20ms(`flt_sd_b=0`) the LDO is restarted and the SUSD\_STAU bit is cleared. Shown in the graph is a read of the interrupt bit register before the 20ms expires. This clears the interrupt bit and the INTN pin is released and rises high.

In the second case, the output is not in the UVP condition for the qualifying time (`UVP_TMR`) and `ldox_uvp_stau` bit returns to 0.

For the third case, the output falls for longer than `UVP_TMR` and the interrupt bit is set, the LDO is disabled, the Status bit reset and the `ldox_susd`, suspend bit is set. Since the interrupt is masked by `ldox_uvp_mask`, the INTN pin is not pulled low until the Mask bit is set back to "0". When the LDO is re-enabled after 20ms(`flt_sd_b = 0`), the `ldox_uvp_int` remains a "1" as the register bit was not read.

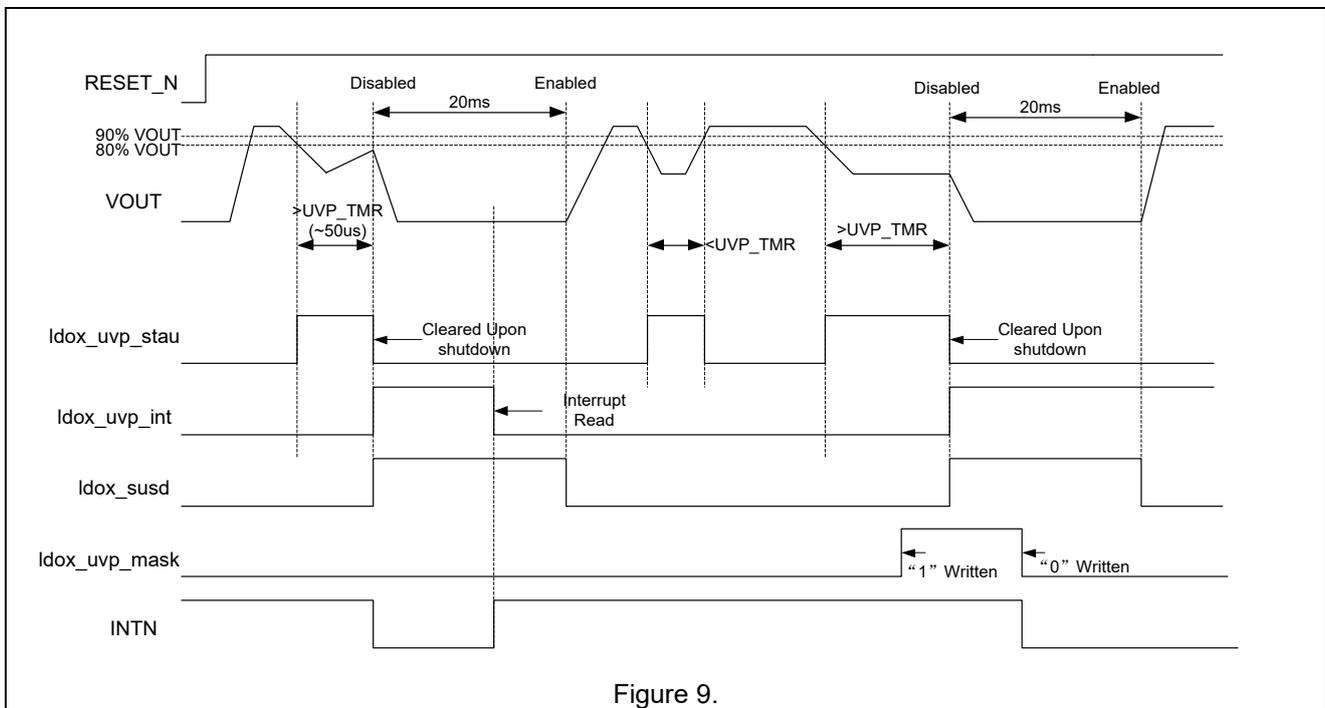

Figure 9.

## Auto Discharging

For each channel, when shut down the output, the Auto-Discharging circuit will be turned on to discharge the electric charge on output capacitor, and decrease the voltage of output pin in very short time. The Auto-Discharging function is optional. Set related bits to select output discharge function for Discharge Resistor (LDO\_DIS Register), "1": Enable. "0": Disable.

## Input and output Capacitor

The LDO1/2 are designed to be stable for ceramic output capacitors with Effective capacitance in the range from 3.3µF to 22 µF. The LDO3~LDO7 are designed to be stable for ceramic output capacitors with Effective capacitance in the range from 1 µF to 10 µF.

The device is also stable with multiple capacitors in parallel, having the total effective capacitance in the specified range. In applications where no low input supplies impedance available, the recommended  $C_{V_{SYS}}$ ,  $C_{V_{IN34}}$ ,  $C_{V_{IN5}}$ ,  $C_{V_{IN6}}$ ,  $C_{V_{IN7}}$ , Capacitance  $\geq 0.68\mu F$  and  $C_{V_{IN12}} \geq 3.3\mu F$ .

# ET59171

## Serial Port Interface (I<sup>2</sup>C)

### Bus Interface

Baseband Processor can transmit data with ET59171 each other through SDA and SCL port. SDA and SCL composite bus interface, and a pull-up resistor to the power supply should be connected.

### Data Validity

When the SCL signal is HIGH, the data of SDA port is valid and stable. Only when the SCL signal is low, the level on the SDA port can be changed.

### Start (Re-start) and Stop Working Conditions

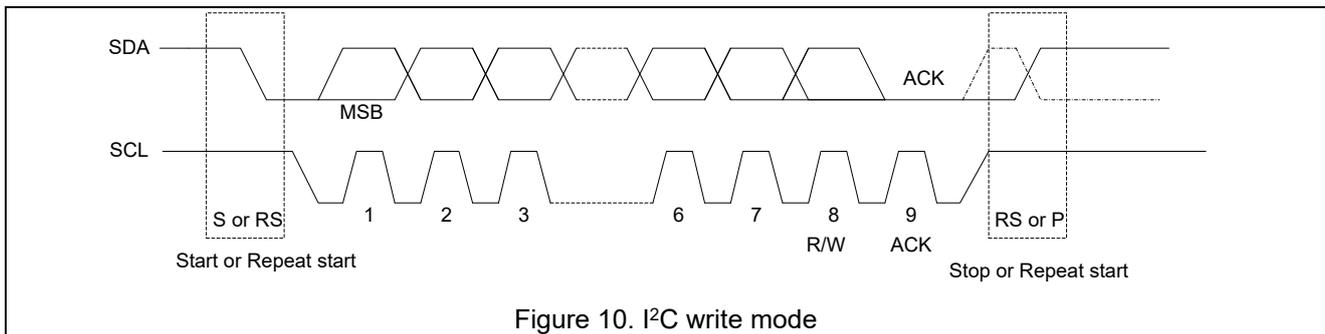

When the SCL signal is high, SDA signal from high to low represents start or re-start working conditions, while the SCL signal is high, SDA signal from low to high represents stop working conditions.

### Byte format

Each byte of data line contains 8 bits, which contains an acknowledge bit. The first data is transmitted MSB.

### Acknowledge

During the writing mode, ET59171 will send a low-level response signal with one period width to the SDA port. During the reading mode, ET59171 will not send response signal and the host will send a high response signal one period width to the SDA.

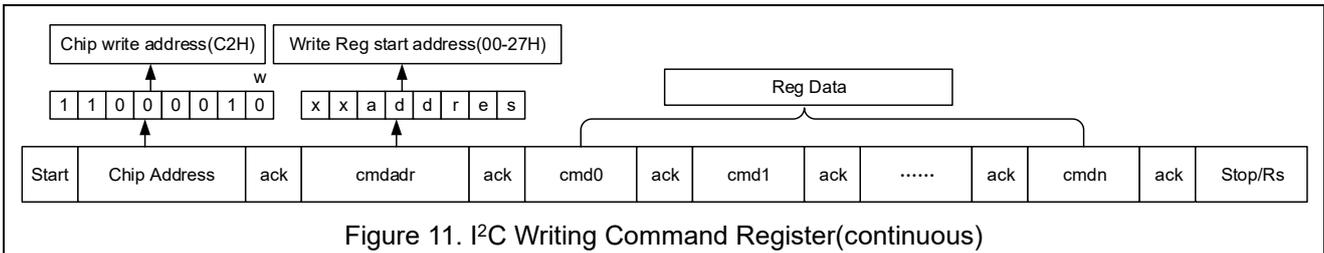

- ACK=Acknowledge
- MSB=Most Significant Bit
- S=Start Conditions RS=Restart Conditions P=Stop Conditions
- Fastest Transmission Speed =1000KBITS/S
- Restart: SDA-level turnover as expressed by the dashed line waveform

### I<sup>2</sup>C Slave Address

The default 7bit I<sup>2</sup>C slave address is 1100001b(0x61), and 8bit address for the writing register mode is 11000010b(0xC2), the reading register mode is 11000011b(0xC3). The I<sup>2</sup>C address can also be changed by setting the 2 bits in register 0x12, i2c\_adr\_sel[1:0] register bits reflects the default options available for request. The Address register will be cleared back to default setting anytime a power-on-reset POR or when a software reset is implemented in the SOFT\_RESET register.

## •0x03 LDO\_EN Register ----LDOs Chip Enable Control Register. Default = 0x80

LDO enable control register by I<sup>2</sup>C while the register value of ldox\_seq[2:0] are set to be default "000".

This register can be written to enable or disable the corresponding LDO regulator.

Bit	Name	Default	Type	Description
7	vsys_en	1	R/W	Enable Bit for System. The system bias will be getting ready for enabling individual LDO if bit7 = 1 and RESET_N is pulled high Please ensure individual LDO in the off state before bit7 = 0
6	ldo7_en	0	R/W	LDO7 Enable Control: <b>0b</b> : Disable <b>1b</b> : Enable
5	ldo6_en	0	R/W	LDO6 Enable Control: <b>0b</b> : Disable <b>1b</b> : Enable
4	ldo5_en	0	R/W	LDO5 Enable Control: <b>0b</b> : Disable <b>1b</b> : Enable
3	ldo4_en	0	R/W	LDO4 Enable Control: <b>0b</b> : Disable <b>1b</b> : Enable
2	ldo3_en	0	R/W	LDO3 Enable Control: <b>0b</b> : Disable <b>1b</b> : Enable
1	ldo2_en	0	R/W	LDO2 Enable Control: <b>0b</b> : Disable <b>1b</b> : Enable
0	ldo1_en	0	R/W	LDO1 Enable Control: <b>0b</b> : Disable <b>1b</b> : Enable

## •0x04 LDO1 Register ---- LDO1 Output Voltage Setting Register. Default = 0x95 Type: R/W

## •0x05 LDO2 Register ---- LDO2 Output Voltage Setting Register. Default = 0x95 Type: R/W

The register LDO1/2\_VSET[7:0] set the voltage of LDO1/ LDO2, it have about 200 steps, shown as below table, the formula is  $V_{OUT}=0.496V+(d-61)*0.008V$ ;

Output Voltage set by LDO1/2_VSET[7:0]		
Dec	Binary	Output Voltage(V)

▪ **0x0B~0x0E LDO12/34/56/7\_SEQ Register ---- Power Sequence Setting Register. Default = 0x00**

Power sequence setting register. there are 7 time slots defined as following table. The power-up sequence is start from slot1 to slot7, and shut down start from slot7 to slot1. Power-up and shut down of each LDO regulator can be set at any one of the slots.

ldox_seq[2:0]	VOUTX
000	Controlled by I <sup>2</sup> C Register ldox_en
001	Slot1
010	Slot2
011	Slot3
100	Slot4
101	Slot5
110	Slot6

6:0	-	00h	R	-

## •0x21 LDO2\_EN\_BK Register ---- LDO2 BAKUP Enable Register. Default = 0x00

Bit	Name	Default	Type	Description
7	ldo2_en_bk	0	R/W	LDO2 Backup Enable Control Signal <b>0b:</b> Disable LDO2 Output. <b>1b:</b> Enable LDO2 Output.
6:0	-	00h	R	-

## •0x22 LDO3\_EN\_BK Register ---- LDO3 BAKUP Enable Register. Default = 0x00

Bit	Name	Default	Type	Description
7	ldo3_en_bk	0	R/W	LDO3 Backup Enable Control Signal <b>0b:</b> Disable LDO3 Output. <b>1b:</b> Enable LDO3 Output.
6:0	-	00h	R	-

## •0x23 LDO4\_EN\_BK Register ---- LDO4 BAKUP Enable Register. Default = 0x00

Bit	Name	Default	Type	Description
7	ldo4_en_bk	0	R/W	LDO4 Backup Enable Control Signal <b>0b:</b> Disable LDO4 Output. <b>1b:</b> Enable LDO4 Output.
6:0	-	00h	R	-

# ET59171

## •0x24 LDO5\_EN\_BK Register ---- LDO5 BAKUP Enable Register. Default = 0x00

Bit	Name	Default	Type	Description
7	ldo5_en_bk	0	R/W	LDO5 Backup Enable Control Signal <b>0b:</b> Disable LDO5 Output. <b>1b:</b> Enable LDO5 Output.
6:0	-	00h	R	-

## •0x25 LDOX\_EN\_BK Register ---- LDO6 BAKUP Enable Register. Default = 0x00

Bit	Name	Default	Type	Description
7	ldo6_en_bk	0	R/W	LDO6Backup Enable Control Signal <b>0b:</b> Disable LDO6 Output. <b>1b:</b> Enable LDO6 Output.
6:0	-	00h	R	-

## •0x26 LDO7\_EN\_BK Register ---- LDO7 BAKUP Enable Register. Default = 0x00

Bit	Name	Default	Type	Description
7	ldo7_en_bk	0	R/W	LDO7 Backup Enable Control Signal <b>0b:</b> Disable LDO7 Output. <b>1b:</b> Enable LDO7 Output.
6:0	-	00h	R	-

**Note:** ldox\_en\_bak and ldox\_en(x=1~7) are OR relation, such as when ldo1\_en or ldo1\_en\_bak set to high, then LDO1 will be enable, when ldo1\_en and ldo1\_en\_bak set to low, then LDO1 will be disable. Other six LDOs enable signal relation is the similar with LDO1. Recommend using only one control method to control LDO.

## •0x27 LDO\_FLT\_MASK Register ----LDO Filter Capacitor Mask Control Register. Default = 0x00

Each LDO Filter Capacitor Mask enable control.

Bit	Name	Default	Type	Description
7	Rev.	0	R	
6	Ldo7flt_mask	0	R/W	LDO7 Filter Capacitor Mask Enabled/Disabled Control: <b>0b:</b> Disable Don't mask LDO7 filter capacitor <b>1b:</b> Enable Mask LDO7 filter capacitor, it will accelerate the response speed

# ET59171

				of dynamic voltage regulation
5	Ldo6flt_mask	0	R/W	LDO6 Filter Capacitor Mask Enabled/Disabled Control: <b>0b:</b> Disable Don't mask LDO6 filter capacitor <b>1b:</b> Enable Mask LDO6 filter capacitor, it will accelerate the response speed of dynamic voltage regulation
4	Ldo5flt_mask	0	R/W	LDO5 Filter Capacitor Mask Enabled/Disabled Control: <b>0b:</b> Disable Don't mask LDO5 filter capacitor <b>1b:</b> Enable Mask LDO5 filter capacitor, it will accelerate the response speed of dynamic voltage regulation
3	Ldo4flt_mask	0	R/W	LDO4 Filter Capacitor Mask Enabled/Disabled Control: <b>0b:</b> Disable Don't mask LDO4 filter capacitor <b>1b:</b> Enable Mask LDO4 filter capacitor, it will accelerate the response speed of dynamic voltage regulation
2	Ldo3flt_mask	0	R/W	LDO3 Filter Capacitor Mask Enabled/Disabled Control: <b>0b:</b> Disable Don't mask LDO3 filter capacitor <b>1b:</b> Enable Mask LDO3 filter capacitor, it will accelerate the response speed of dynamic voltage regulation
1	Ldo2flt_mask	0	R/W	LDO2 Filter Capacitor Mask Enabled/Disabled Control: <b>0b:</b> Disable Don't mask LDO2 filter capacitor <b>1b:</b> Enable Mask LDO2 filter capacitor, it will accelerate the response speed of dynamic voltage regulation
0	Ldo1flt_mask	0	R/W	LDO1 Filter Capacitor Mask Enabled/Disabled Control: <b>0b:</b> Disable Don't mask LDO1 filter capacitor <b>1b:</b> Enable Mask LDO1 filter capacitor, it will accelerate the response speed of dynamic voltage regulation

When using the dynamic voltage adjustment function, the filter needs to be disabled. After the voltage adjustment is completed, the filter should be enabled. When  $V_{IN}$  is greater than  $V_{OUT\_target\_max} + 1.2V$ , the voltage adjustment speed can get faster.

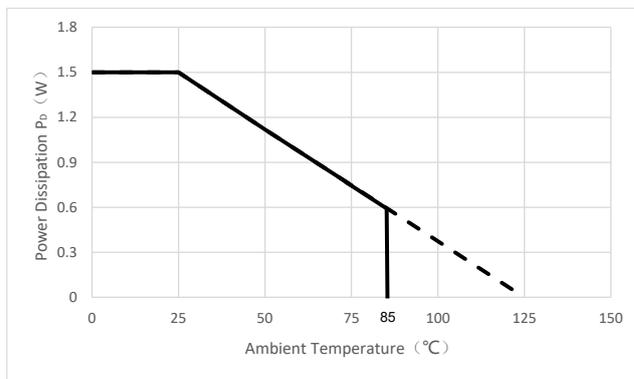

# ET59171

## Absolute Maximum Ratings

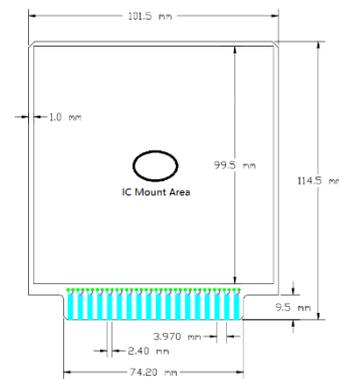

Symbol	Parameters (Items)	Value	Unit
$V_{POWER}$	$V_{SYS}, V_{IN12}, V_{IN34}, V_{IN5}, V_{IN6}, V_{IN7}$ POWER IN Pins Voltage	-0.3 to 6	V
$V_{LDO1-7}$	POWER OUT Pins Voltage	$-0.3 \text{ to } (V_{IN} + 0.3) \leq 6$	V
$V_{CONTROL}$	SDA, SCL and RESET_N Pins Voltage	-0.3 to 6	V
$V_{INTN}$	INTN Pin Voltage	-0.3 to 6	V
$P_D^{(1)(2)}$	Maximum Power Consumption, $T_A=25^\circ\text{C}$	1500	mW
$R_{\theta JA}^{(1)}$	Thermal Resistance, Junction-to-Ambient, $T_A=25^\circ\text{C}$	67	$^\circ\text{C/W}$
$T_J$	Operating Junction Temperature	-40 to 150	$^\circ\text{C}$
$T_{STG}$	Storage Temperature	-65 to 150	$^\circ\text{C}$
$T_{SLOD}$	Lead Temperature (Soldering, 10 sec)	300	$^\circ\text{C}$
$V_{ESD}^{(3)}$	HBM	$\pm 2000$	V
	CDM	$\pm 500$	V

**Note1:**  $P_D$  and  $R_{\theta JA}$  are measured under natural convection (still air) at  $T_A = 25^\circ\text{C}$  with the component mounted on 101.5\*114.5mm FR-4, 4layer, Top and Bottom layer 1.5oz, both two inner layer 1oz. Meet JEDEC (JESD51-9) standard.

**Note2:** Recommended operating conditions are only used to limit the reasonable use range of the single condition of the product, and the circuit use must comply with other instructions in the manual. For parameter performance indicators, please refer to the EC table and the test condition specification in the table.

Power Dissipation

Measurement Board Pattern

**Note3:** This device series incorporates ESD protection and is tested by the following methods:

HBM tested per JEDEC JS-001

CDM tested per JEDEC JS-002

# ET59171

## Recommended Operating Conditions

Symbol	Parameters	Rating	Unit
$V_{VSYS}$	Supply Input Voltage	2.7 to 5.5	V
$V_{VIN12}$	Supply Input Voltage	0.6 to 2.0	V
$V_{VIN34}$	Supply Input Voltage	1.8 to 5.5 & $\leq V_{SYS}$	V
$V_{VIN5}$	Supply Input Voltage	1.8 to 5.5 & $\leq V_{SYS}$	V
$V_{VIN6}$	Supply Input Voltage	1.8 to 5.5 & $\leq V_{SYS}$	V
$V_{VIN7}$	Supply Input Voltage	1.8 to 5.5 & $\leq V_{SYS}$	V
$I_{LDO3-7}$	Output Current(600mA LDO)	0 to 600	mA
$I_{LDO1/2}$	Output Current(1500mA LDO)	0 to 1500	mA
$T_A$	Operating Ambient Temperature	-40 to 85	°C
$C_{VIN12}$	Effective Input Ceramic Capacitor Value	4.7 to 47	uF
$C_{VSYS}/C_{VIN34}/$ $C_{VIN5}/C_{VIN6}/C_{VIN7}$	Effective Input Ceramic Capacitor Value	0.68 to 10	uF
$C_{VREF}$	Effective Bypass Ceramic Capacitor Value	0 to 1	uF
$C_{LDO1/2}$	Effective Output Ceramic Capacitor Value (1500mA LDO)	4.7 to 22	uF

	Power Supply Rejection Ratio ( $V_{V_{SYS}}$ to $V_{OUT5-7}$ )	$V_{V_{SYS}}$ to $V_{LDO5-7}$ , $f = 1kHz$ , $C_{LDO5-7} = 2.2\mu F$ , $I_{OUT} = 100mA$ $V_{V_{SYS}} = V_{LDOx\_VSET} + 1V$ , $T_A = 25^{\circ}C$		105		
		$V_{V_{SYS}}$ to $V_{LDO5-7}$ , $f = 1MHz$ , $C_{LDO5-7} = 2.2\mu F$ , $I_{OUT} = 100mA$ $V_{V_{SYS}} = V_{LDOx\_VSET} + 1V$ , $T_A = 25^{\circ}C$		60		
R <sub>LOW</sub> _LDO5~7	Output Resistance of Auto Discharge at Off State	$V_{V_{SYS}} = V_{IN5-7} = 3.8V$ , $V_{RESET\_N} = 0V$ , or Shutdown by I <sup>2</sup> C, $I_{OUT} = 10mA$ , $T_A = 25^{\circ}C$	20	50	80	$\Omega$
t <sub>ON</sub> _LDO5~7 <sup>(6)(10)</sup>	Output Turn-on Delay Time	From enable to $V_{OUT} = 95\%$ of $V_{OUT(NOM)}$		160	900	us

**Note4:** Here  $V_{VINx}$  means internal circuit can work normal. If  $V_{VINx} < V_{LDOx}$ , Output voltage follows  $V_{VINx}$  ( $I_{OUT} = 1mA$ ), circuit is safety.

**Note5:** Here  $V_{V_{SYS}} > V_{UVLO\_V_{SYS}}$  means internal control circuit can work normal. If  $V_{V_{SYS}} < 2.7V$  or  $V_{V_{SYS}} < V_{LDO1/2} + 1.6V$ , some performance parameters cannot be guaranteed.

**Note6:** Guaranteed by design and characterization. not a FT item.

**Note7:**  $V_{DROP\_LDOx}$  FT test method: test the  $V_{LDOx}$  voltage at  $V_{LDOx\_vset} + V_{DROPMAX}$  with output current. Guaranteed by design and characterization except  $V_{OUT} = 1.8V$  and  $V_{OUT} = 2.8V$ , not FT items.

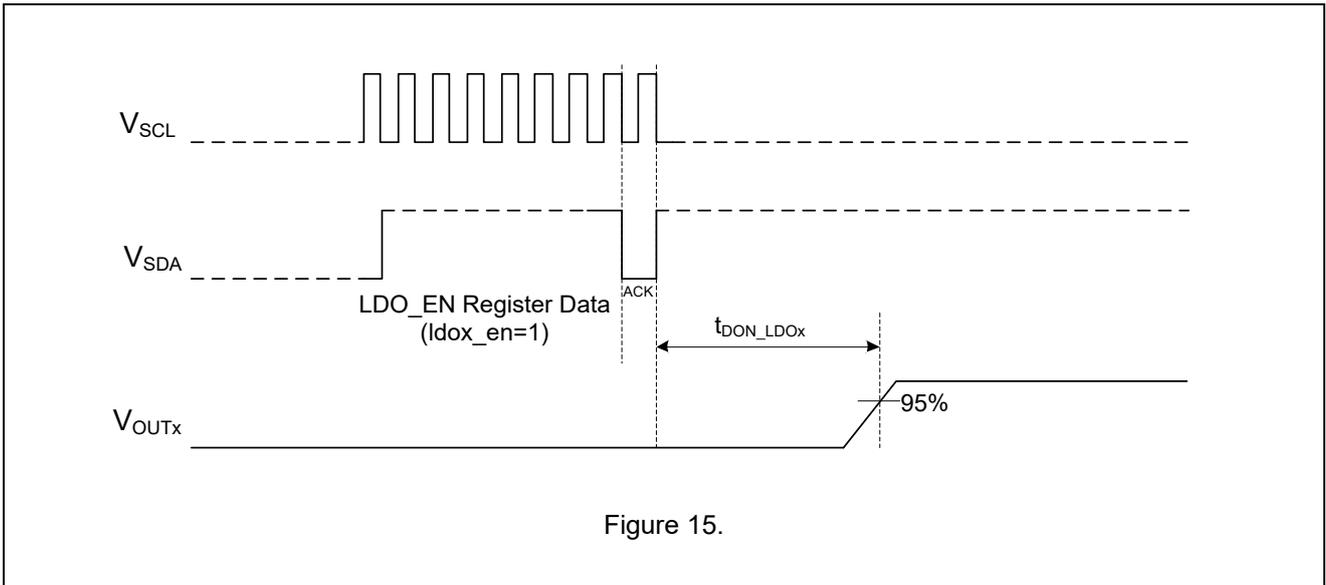

**Note8:** Since the power on process of  $V_{SYS}$  needs a large current, the BIAS should have a current driving capacity of more than 100mA.

**Note9:** Please ensure individual LDO in the off state before  $v_{sys\_en} = 0$  (0x03 LDO\_EN Register: bit7).

**Note10:**  $T_{ON\_LDOx}$  timing diagram shown as below(x = 1~7)

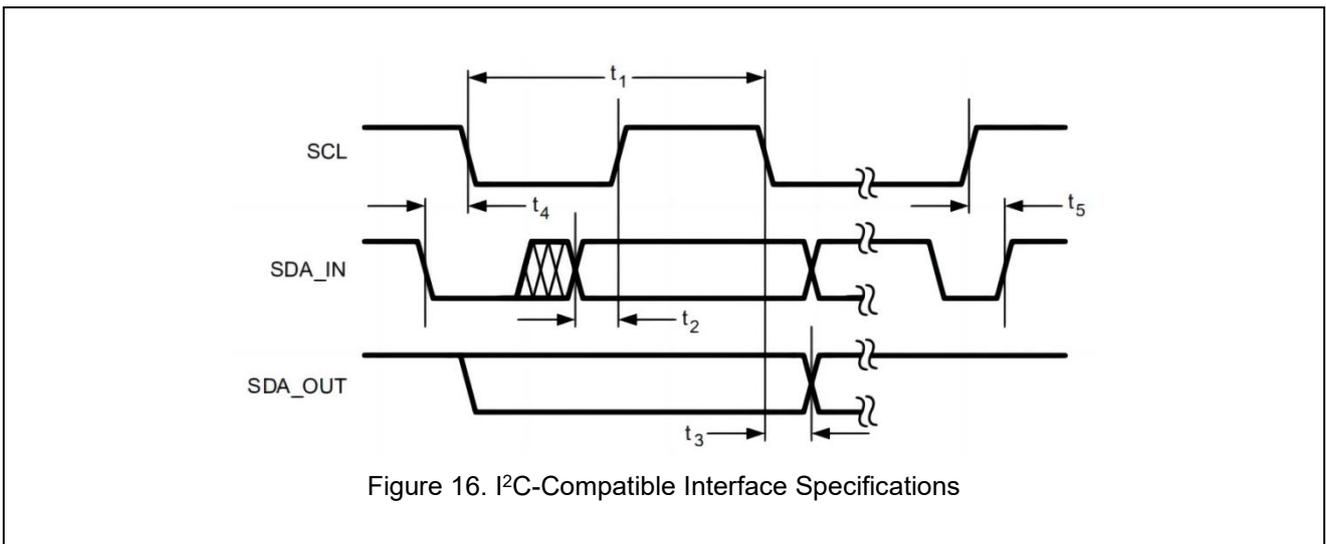

**Note11:**  $V_{SYS} - V_{IN12} \geq 1.2V$  is need to ensure LDO1/2 current limit function normal.

## Application Circuits

**Note \*:**

Resistances ( $VDD\_IO = 1.2V$ ,  $R\_PU = 1.8K$ ;  $VDD\_IO = 1.8V$ ,  $R\_PU = 2.7K$ ) are need to connect from DC power supply( $VDD\_IO$ ) to SDA and SCL.

When INTN is Open drain output state, a resistance ( $1.5K\Omega \sim 10K\Omega$ ) is need to connect to DC power supply( $VDD\_IO$ ) and the voltage should be less than  $V_{SYS}$ .

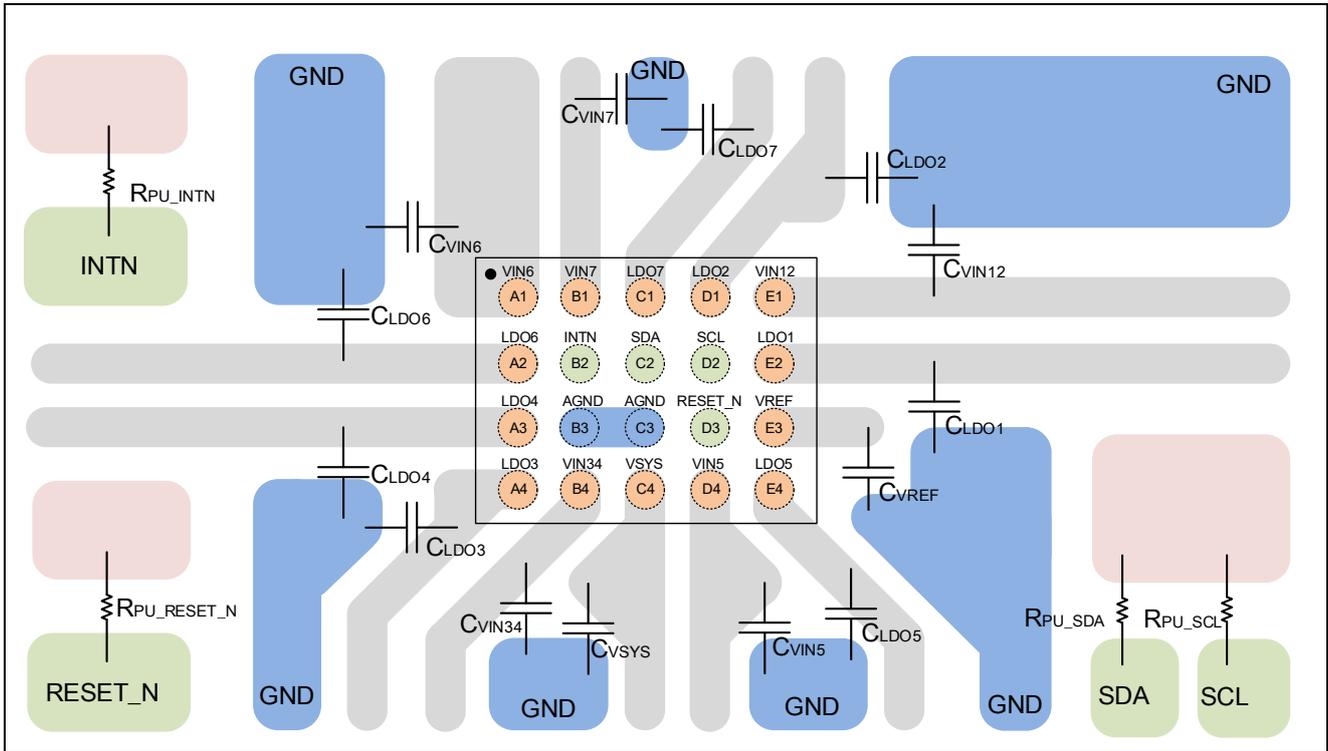

If need, a resistance ( $10K\Omega \sim 1M\Omega$ ) is need to connect from DC power supply( $VDD\_IO$ ) to RESET\_N.

**Note \*\*:**

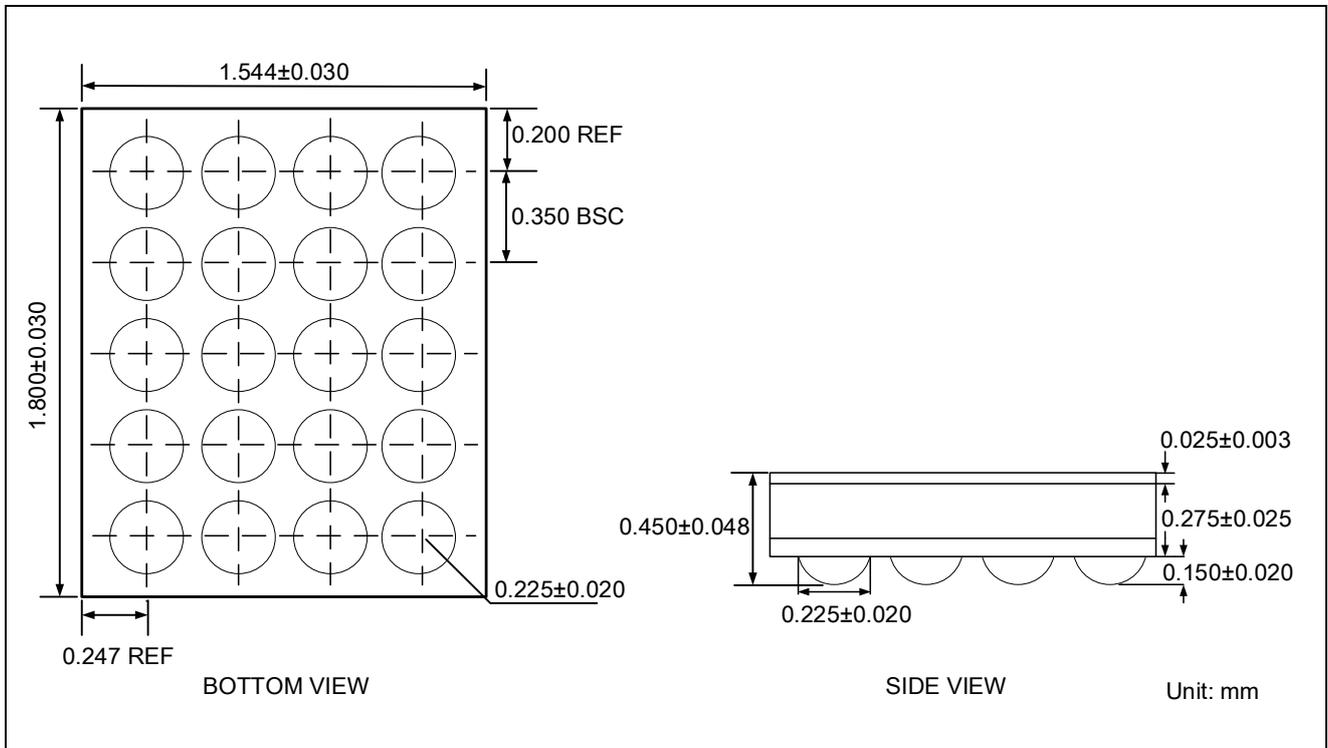

If an LDO is not used, leave the input/output PIN suspended and the software enable bit is disabled.  
If INTN PIN is not used, leave the INTN PIN suspended.

## Revision History and Checking Table

Version	Date	Revision Item	Modifier	Function & Spec Checking	Package & Tape Checking
1.0	2025-08-19	Version 1.0	Yang Xiao Xu	Liu Yi Guo	Liu Jia Ying
1.1	2025-10-30	Add LDO1/2 Current Limit Note	Yang Xiao Xu	Liu Yi Guo	Liu Jia Ying
